Introduction

An animated 2D city-view scene of Bangladesh, built with OpenGL and GLUT in C++ — a riverside skyline that cycles through day, rain, night, and sunset.

- **Built with OpenGL & GLUT**

The entire animated scene is developed in C++ using OpenGL and GLUT.

- **A living skyline**

A central government-style building with the Bangladesh flag, surrounded by homes, offices, trees, street lights, moving vehicles, and a boat on the river.

- **Always changing**

cycles through a clear day, a rainy afternoon, a moonlit night with lit windows, and a sunset — never a fixed image.

Fig: RANDOM CITY VIEW BANGLADESH

Reason for Choosing the Topic

Bangladesh's urban riverside cities, such as Dhaka, are defined by a mix of tall buildings, waterways, and constant traffic — a scene familiar to anyone who has grown up here.

1

A Familiar Scene

Tall buildings, waterways, and constant traffic define riverside cities like Dhaka — a view familiar to anyone who grew up here.

2

Locally Relevant, Not Abstract

Applies 2D primitives, coordinate geometry, color transitions, and animation loops to something meaningful rather than generic shapes.

3

Enough Complexity to Show Range

Day-night transitions, weather effects, and object animation combine many OpenGL/GLUT techniques in one cohesive scene.

Features

Day View

Bright daylight scene with clear skies and sharp building shadows.

Evening View

Warm sunset tones as the sky shifts to orange and pink hues.

Night View

Dark sky with a crescent moon, stars, and glowing window lights.

Rainy Season

Falling rain, grey clouds, and wet reflective streets.

Winter Season

Cooler tones and soft fog give the city a winter feel.

Fast & Slow Movement

Vehicle and boat speeds can be toggled in real time.

Sound Effects

Ambient audio plays alongside key visual events.

Keyboard & Mouse Control

Switch views, seasons, and speeds interactively.

Light System

Street lights and windows glow dynamically by time of day.
